• Jitter (delay variation) occurs due to irregular traffic through the network.

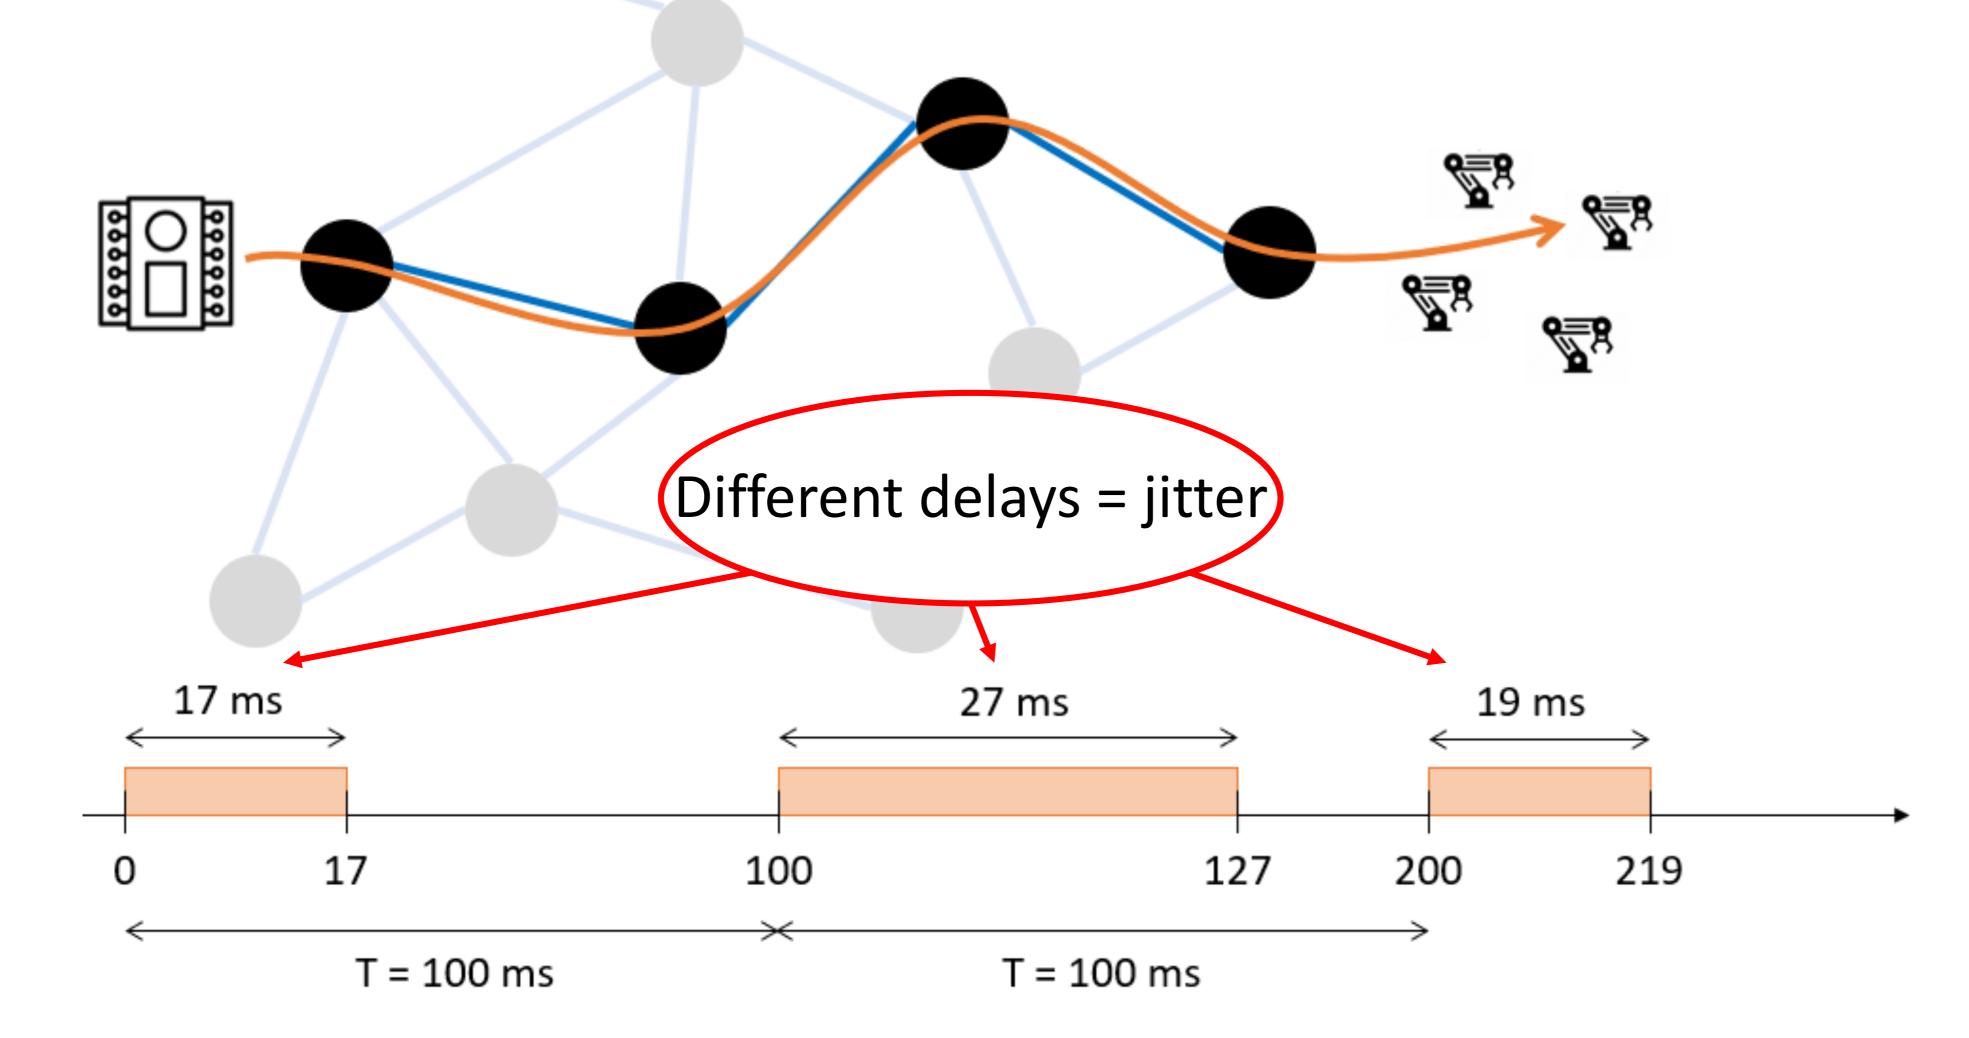

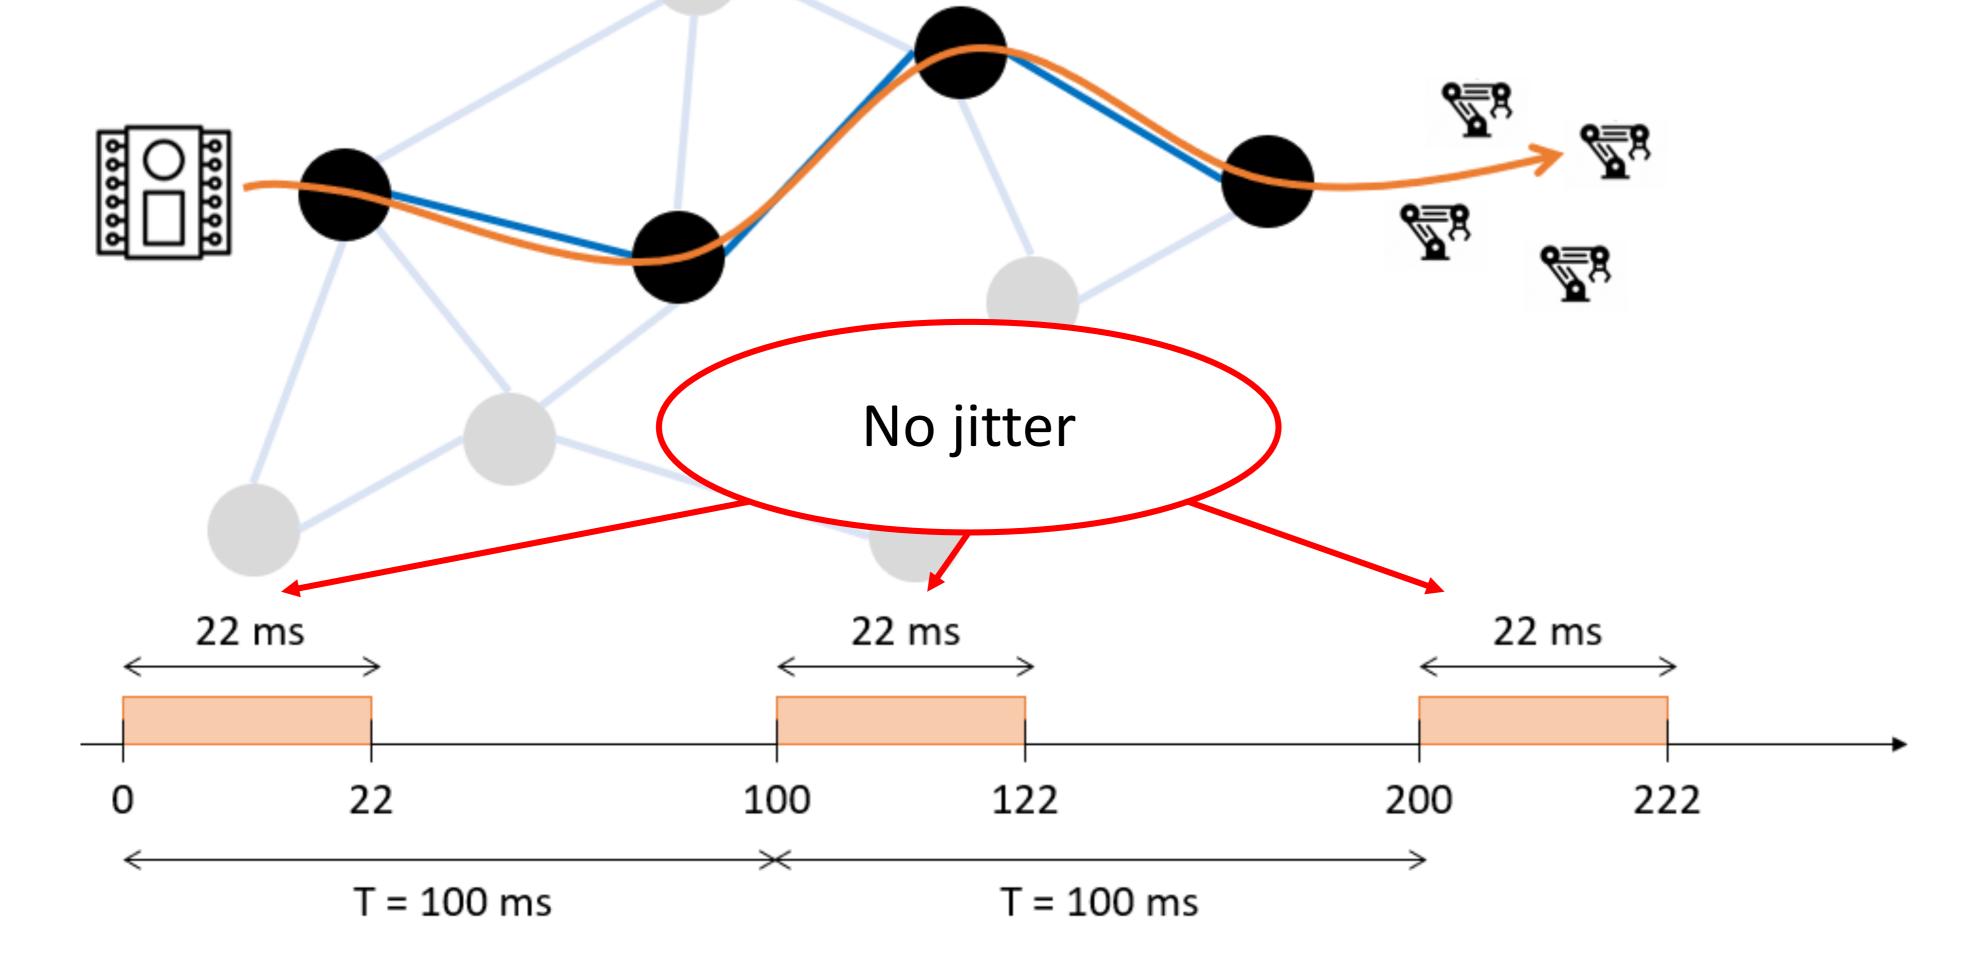

wired networks.

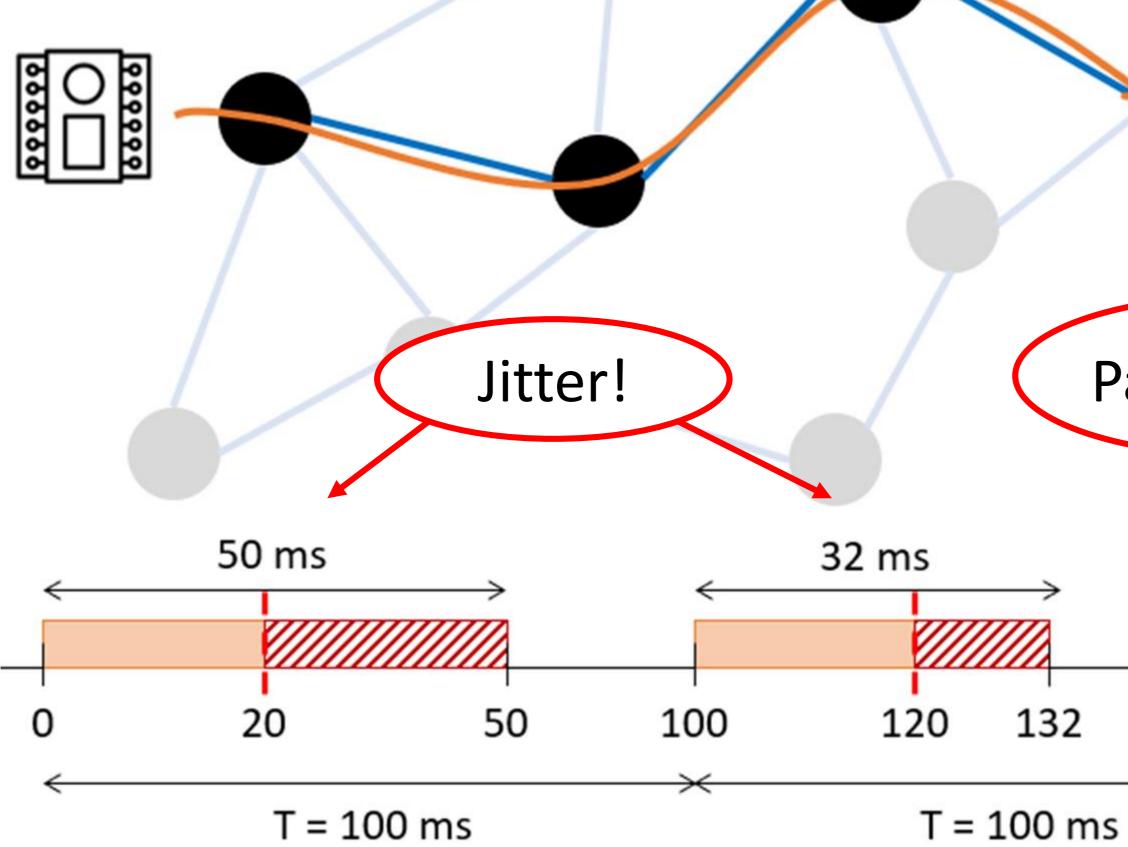

• IEEE Time-Sensitive Networking standards can be implemented to eliminate jitter in

- However, current TSN standards do not guarantee null jitter in wireless networks. • The multipath effect in wireless links causes random delays and even packet loss. ¶¶8 €्ह (1) €₹₿ S S Jitter! Packet loss!! 50 ms 32 ms 200 220 100 132 20 50 120 0

Hold&Forward

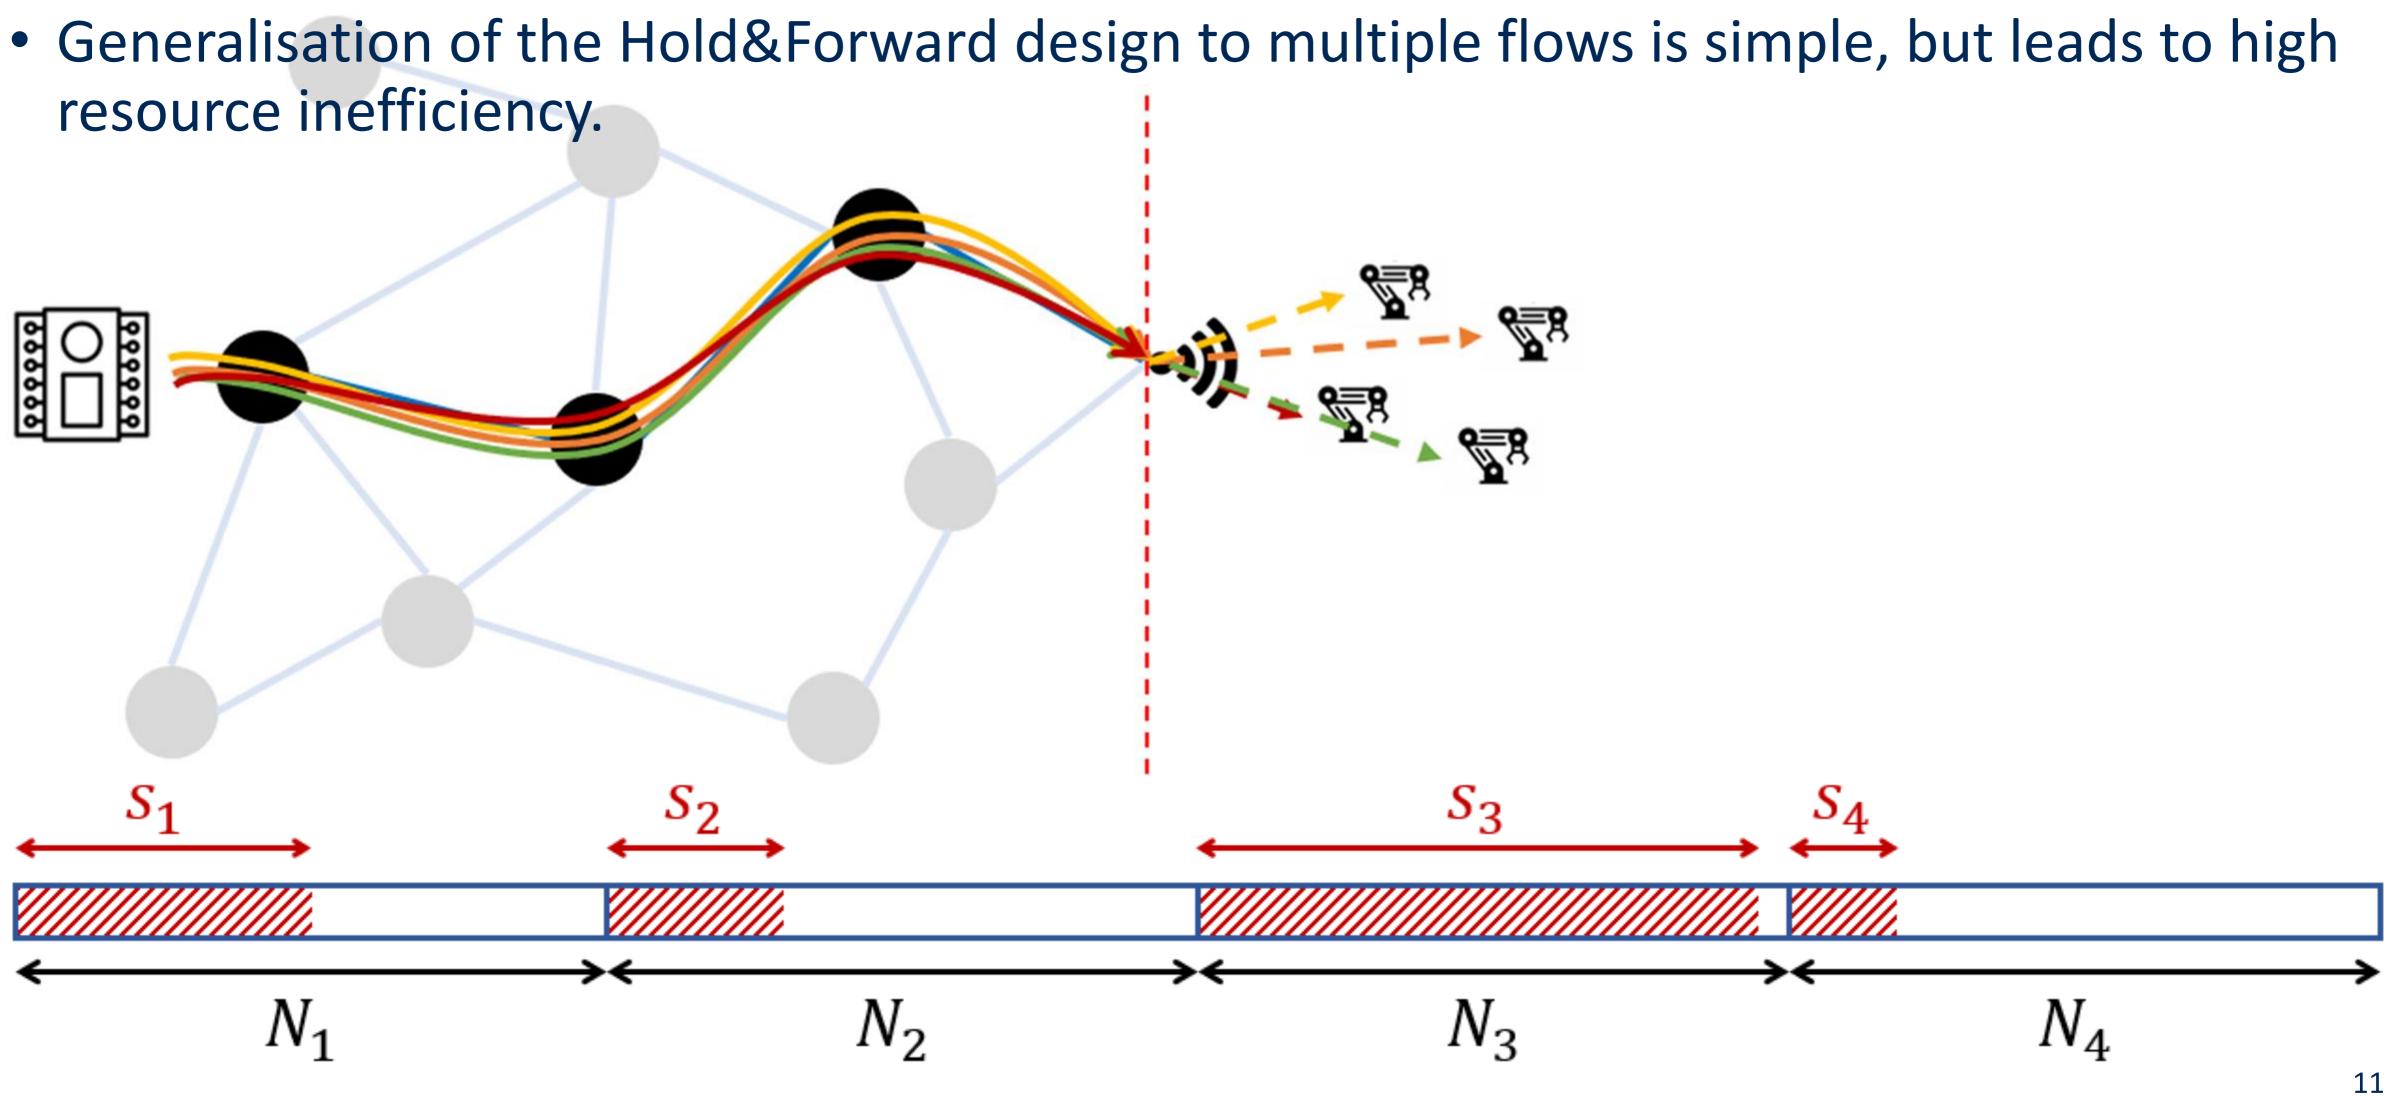

Multiple flows scenario

resource inefficiency.

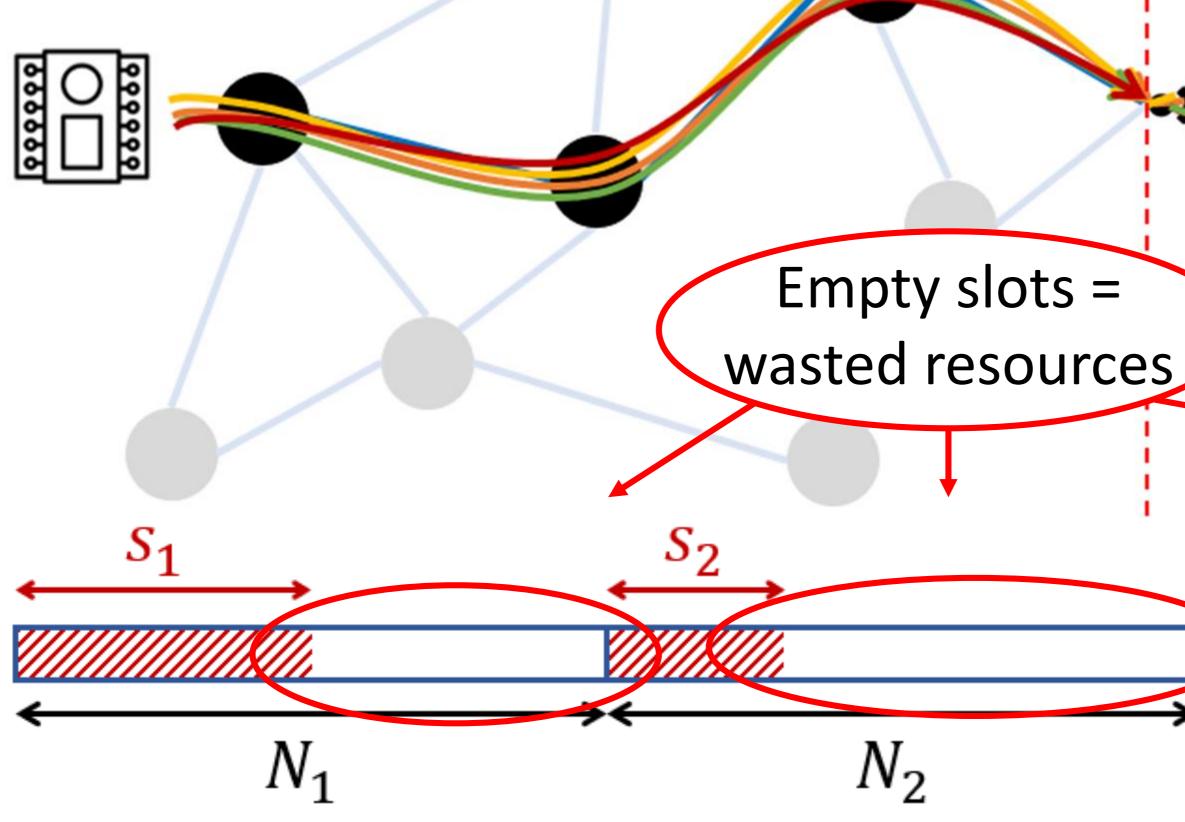

Non-overlapping windows design

resource inefficiency.

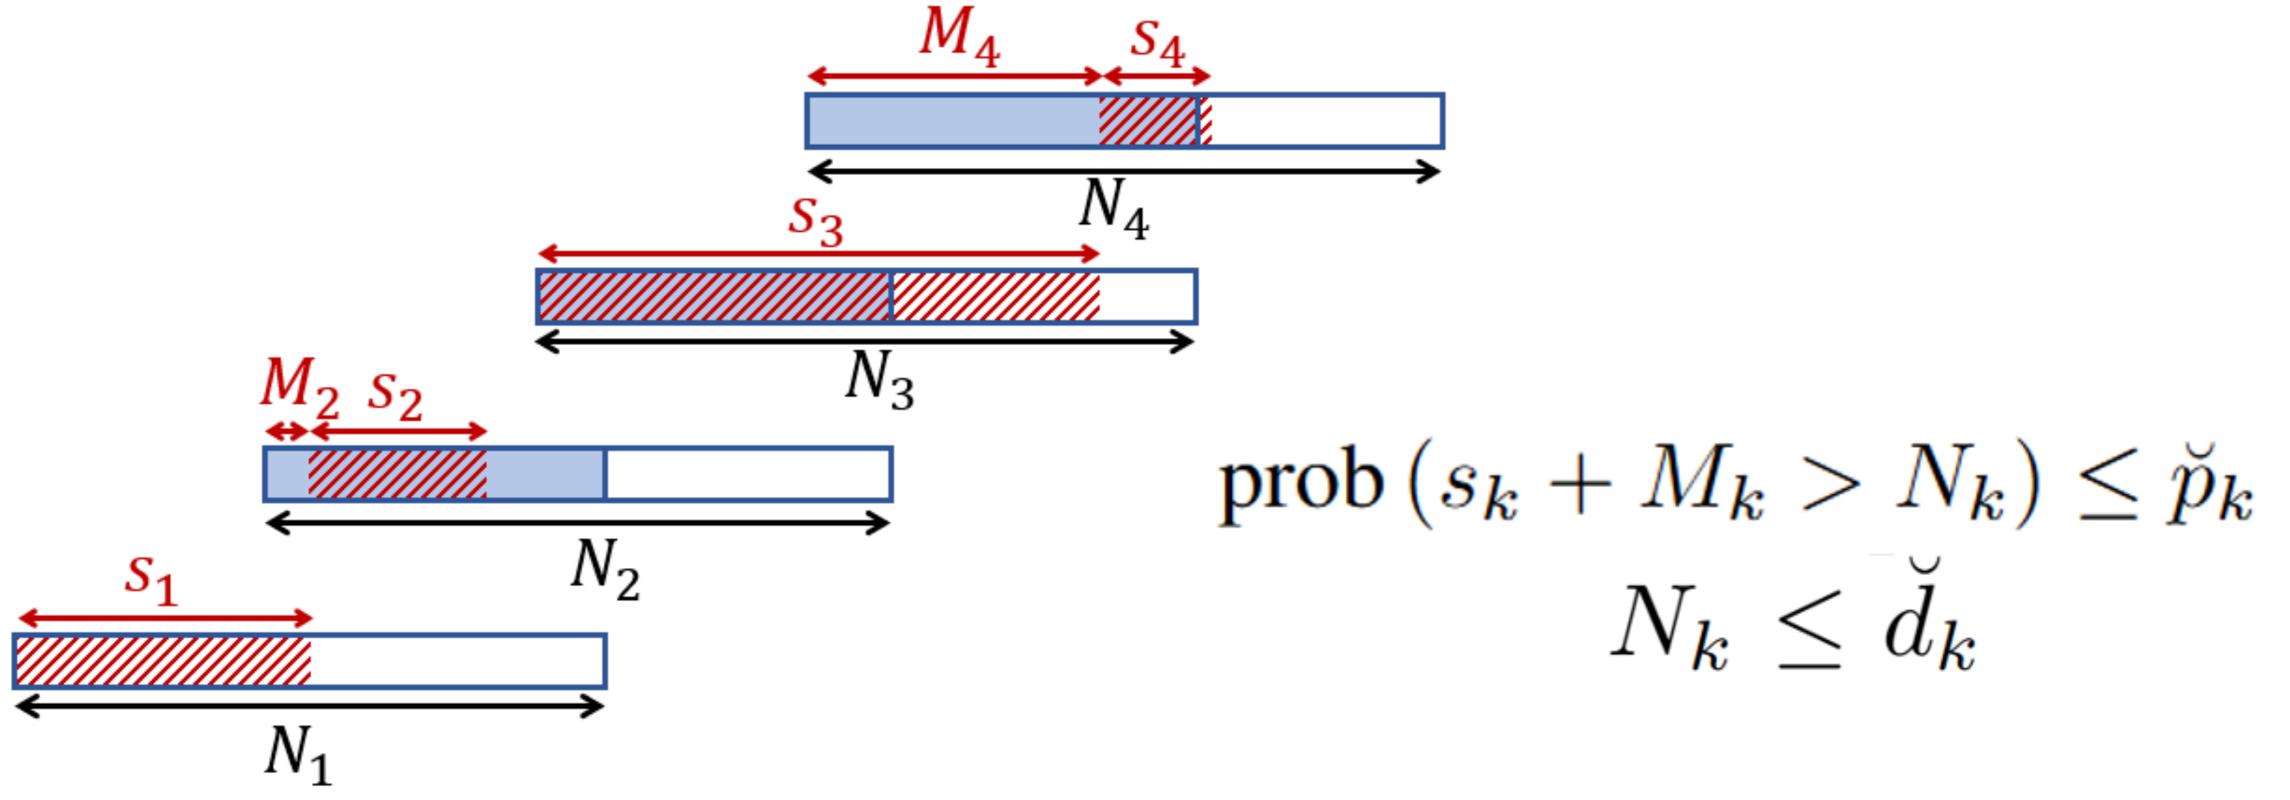

• Generalisation of the Hold&Forward design to multiple flows is simple, but leads to high - S **S** Sz S_A N_3 N_4

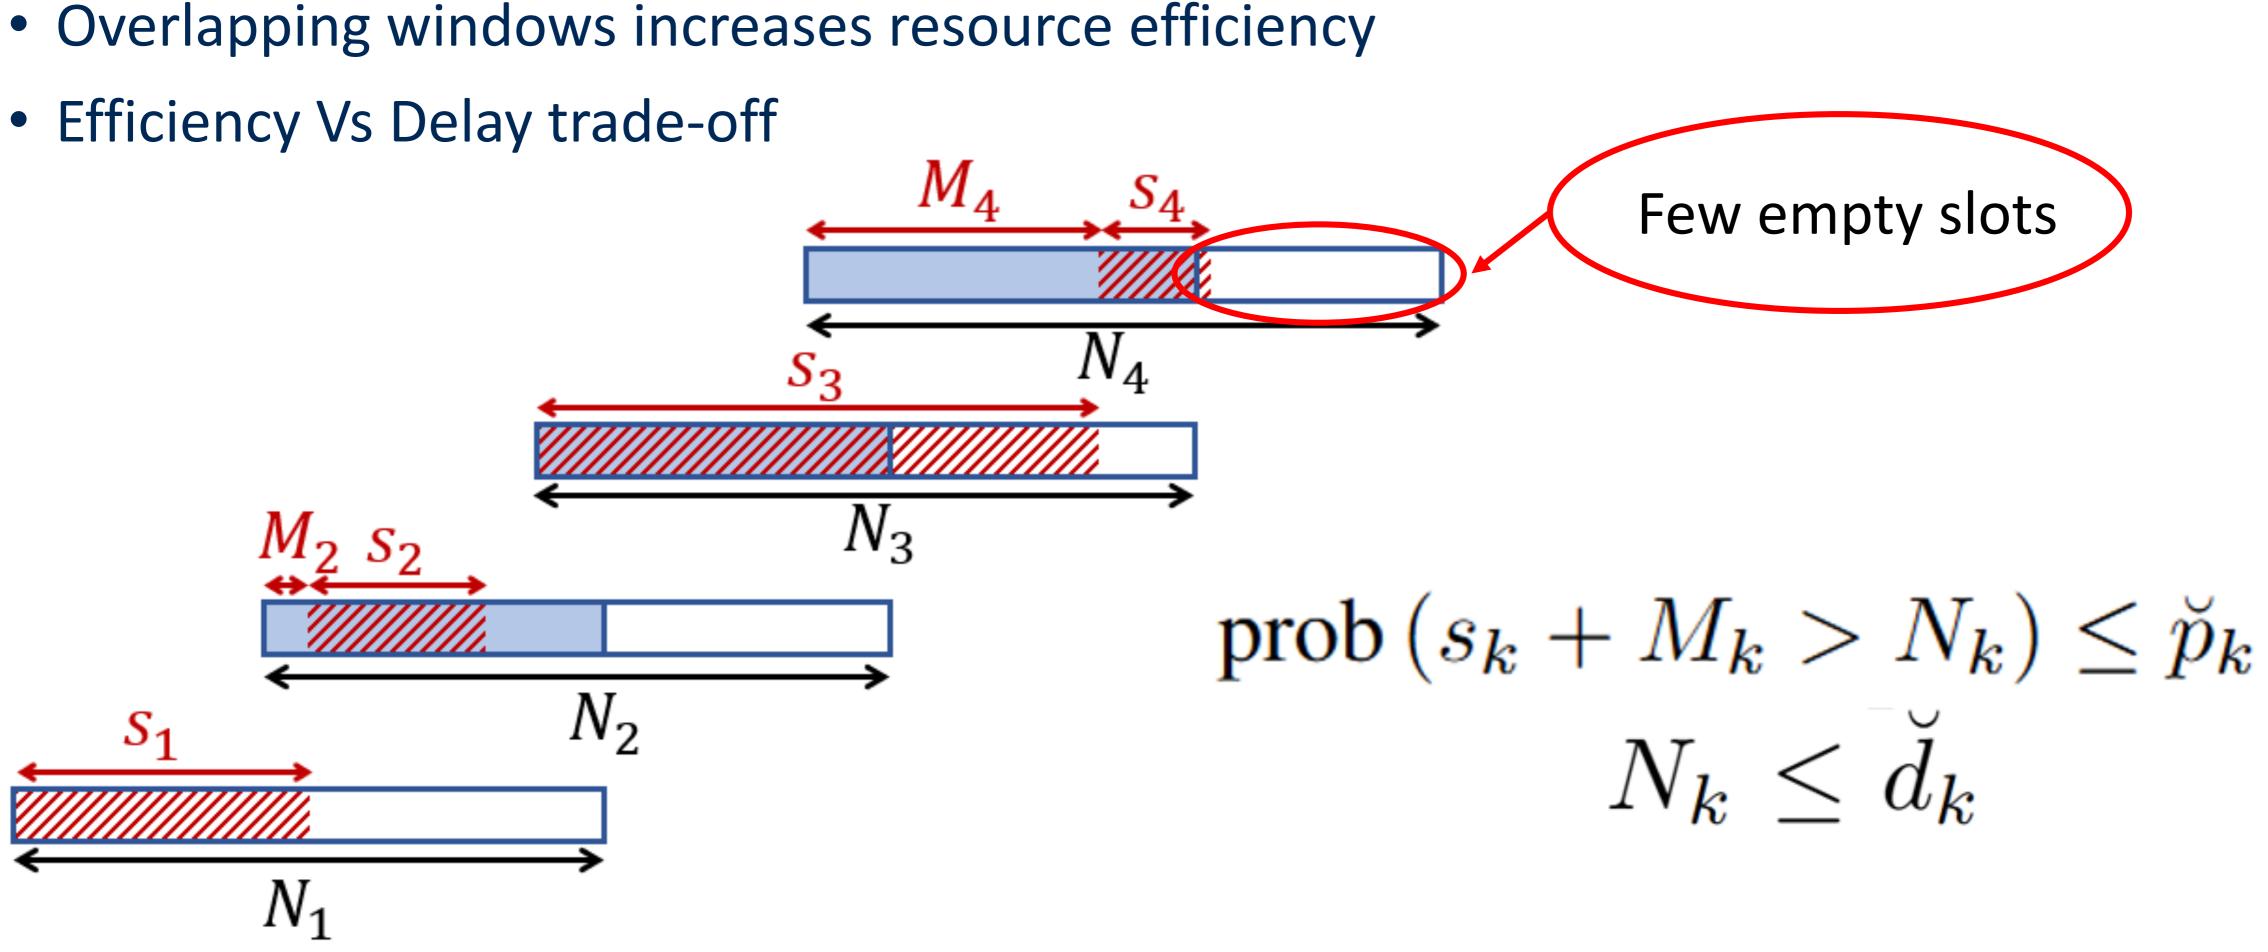

- Overlapping windows increases resource efficiency
- Efficiency Vs Delay trade-off

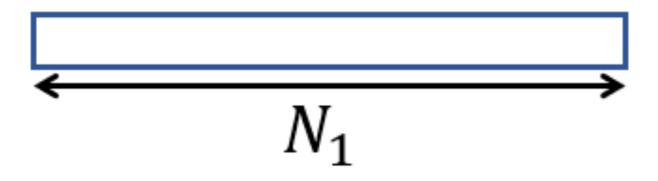

• Design 1st window

$\operatorname{prob}\left(s_1 > N_1\right) \leq \breve{p}_1$

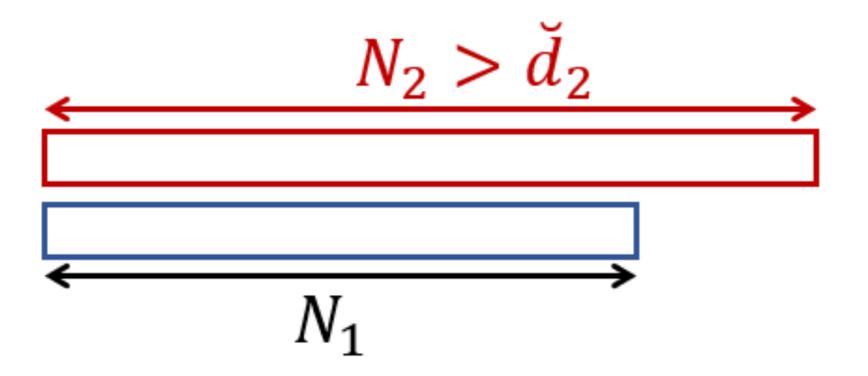

• Design 2nd window

$\operatorname{prob}(s_2 + M_2 > N_2) \le \breve{p}_2$

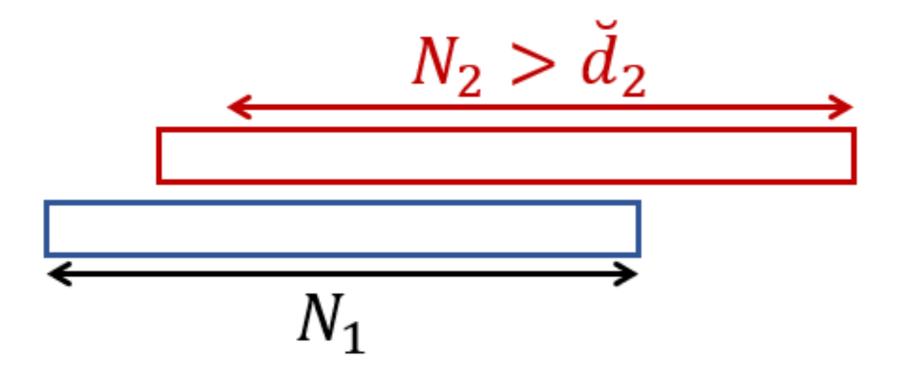

• Design 2nd window

$\operatorname{prob}(s_2 + M_2 > N_2) \le \breve{p}_2$

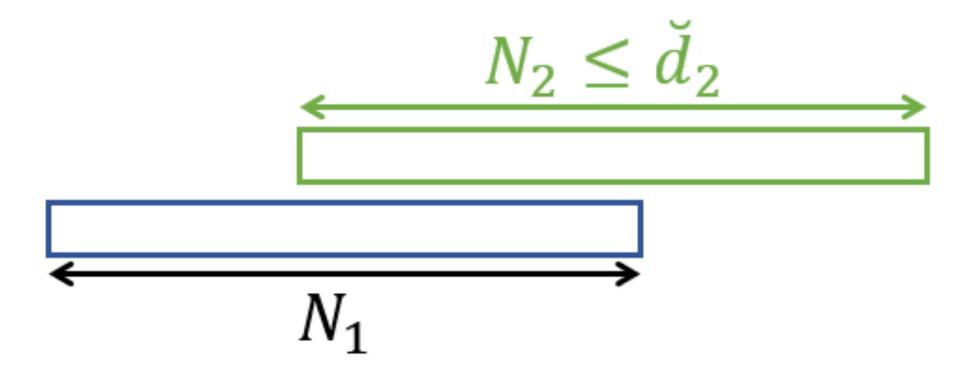

• Design 2nd window

$\operatorname{prob}(s_2 + M_2 > N_2) \le \breve{p}_2$

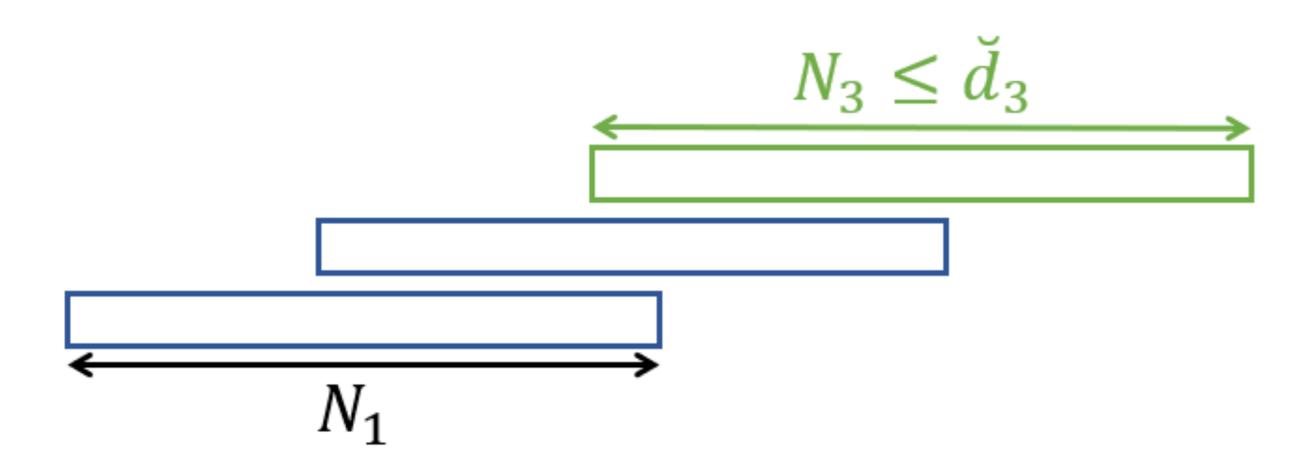

$\operatorname{prob}(s_3 + M_3 > N_3) \le \breve{p}_3$

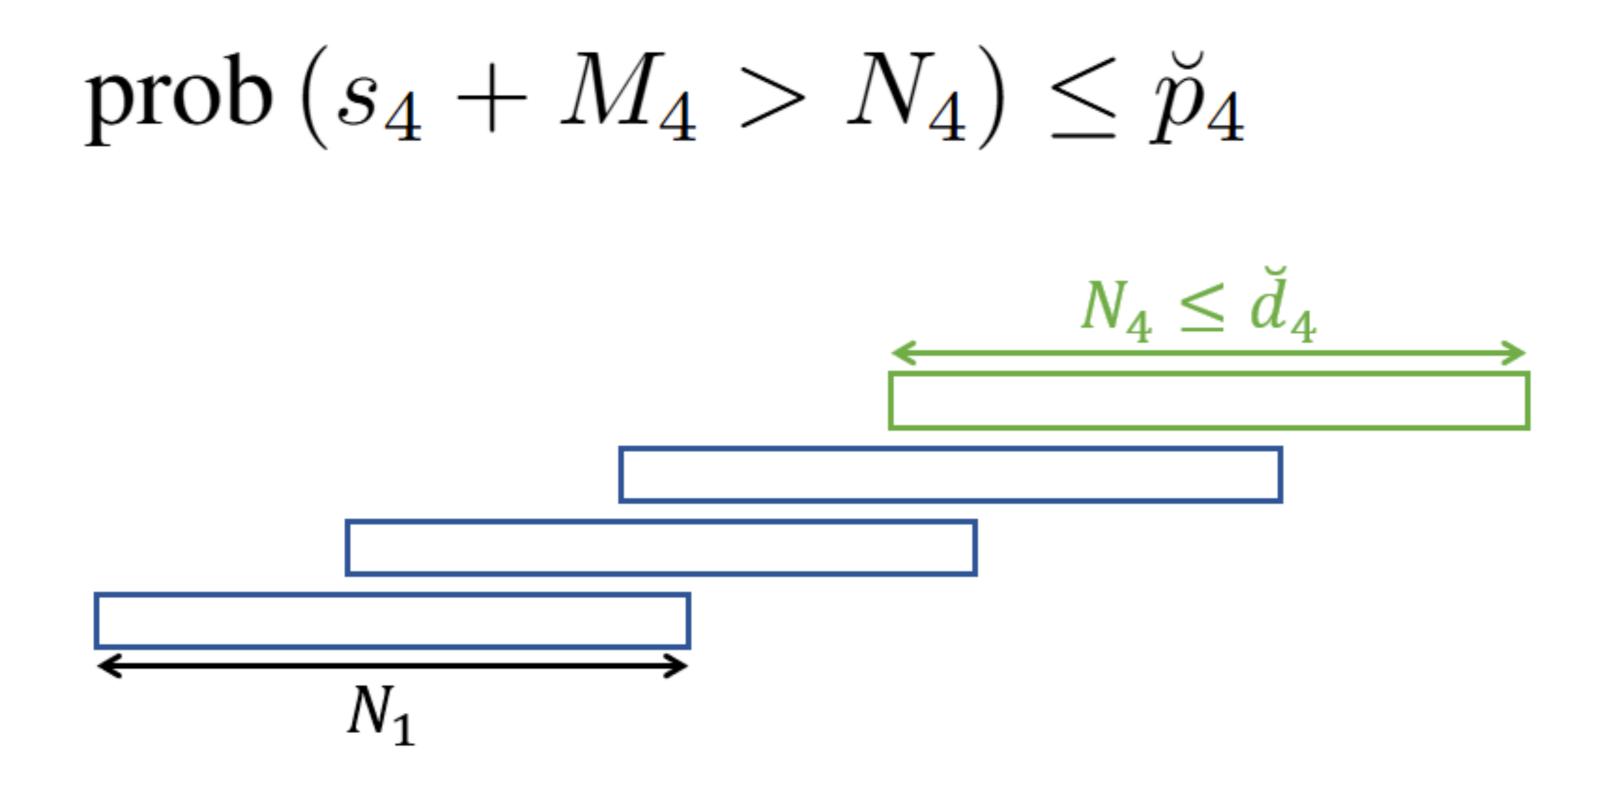

• Design 4th window and so on...

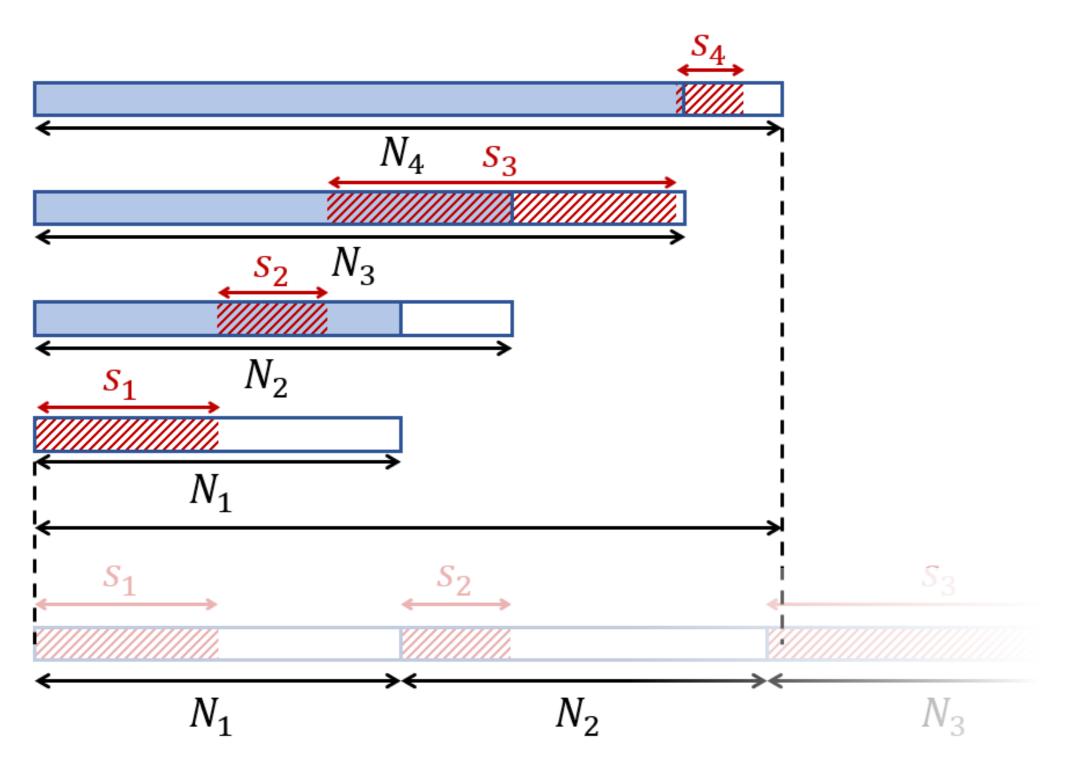

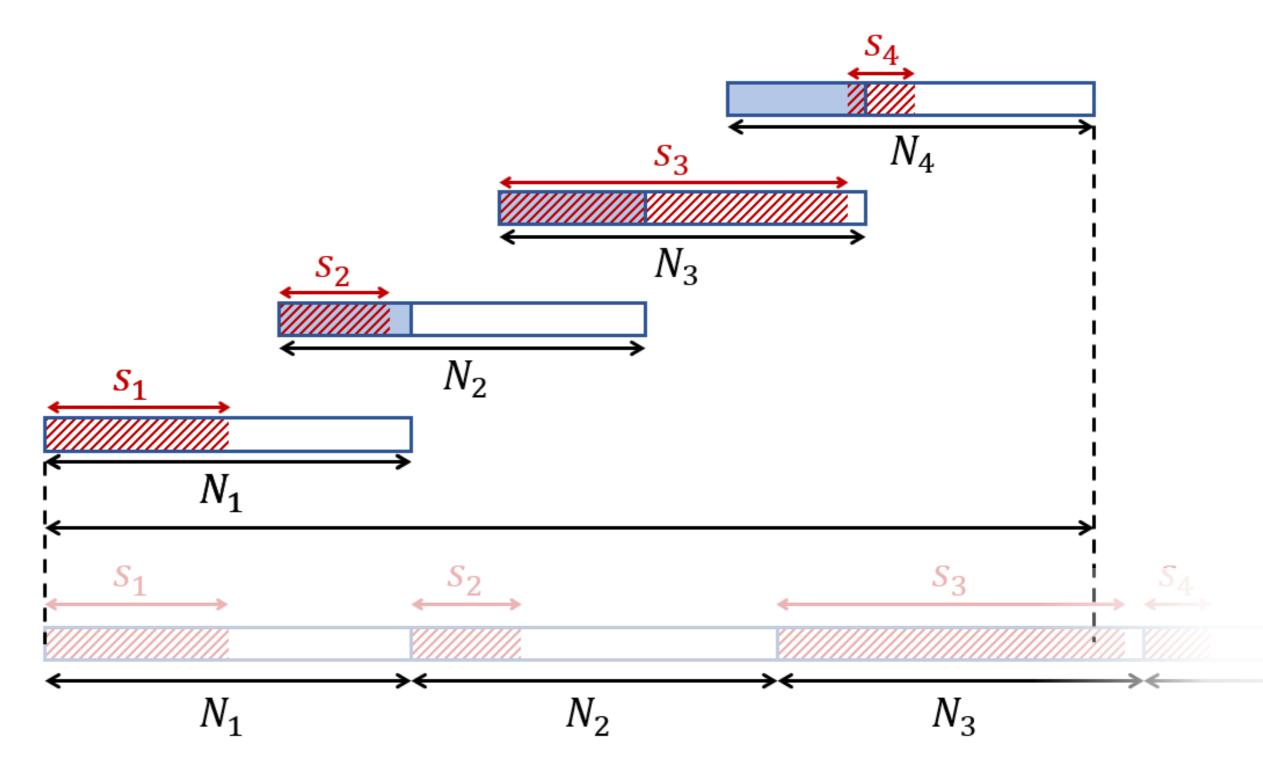

Full overlap (no delay constraints)

Minimum delay (strictest delay constraints)

Control cycle [ms]

Downlink transmission from a wireless access point to multiple receiving terminals.

Simulation parameters

- WiFi 7 with 20 MHz bandwidth
- 1500-Bytes packets with constant control cycle
- Wireless channel is Rayleighdistributed, with 50 ns delay spread and 20 dB average SNR
- 0.2% packet loss tolerance

Closing Remarks

- Two frame design proposals to eliminate jitter in wireless time-sensitive links
- Non-overlapping windows is simple but resource inefficient
- Overlapping windows increases efficency -> more throughput
- Trade-off Efficiency Vs. Delay, but small increases in delay reach nearly maximum efficiency

THANK YOU!

Y. El Kaisi, J. Villares, O. Muñoz Universitat Politècnica de Catalunya (UPC), Barcelona, Spain
